She reports burning pain. What is the most likely diagnosis? A) Herpes simplex virus infection B) Impetigo C) Aphthous ulcer D) Contact dermatitis Answer: A) Herpes simplex virus infection Explanation: The presentation of grouped vesicles on erythema, especially involving the lips and oral mucosa, is characteristic of herpes labialis caused by HSV. The burning sensation further supports this. Impetigo typically presents as honey-colored crusted lesions, aphthous ulcers are painful but ulcerative, and contact dermatitis is usually eczematous rather than vesicular. --- Question 2: Which of the following is the most common cause of psoriasis? A) Bacterial infection B) Genetic predisposition C) Fungal overgrowth D) Autoimmune response Answer: D) Autoimmune response Explanation: Psoriasis is primarily an autoimmune disorder characterized by hyperproliferation of keratinocytes driven by immune dysregulation. While genetic predisposition (B) also plays a role, the core pathogenesis is autoimmune. Infections and fungal overgrowth are not primary causes but can trigger or exacerbate psoriasis. --- Question 3: A pigmented lesion on the back has irregular borders, variegated colors, and measures 8 mm in diameter. What is the most appropriate next step? A) Observation B) Complete excisional biopsy C) Topical corticosteroids D) Antibiotic therapy Answer: B) Complete excisional biopsy Explanation: Features such as irregular borders, color variegation,
